The Ecology of Kalimantan is a comprehensive ecological survey of one of Indonesia's largest and most diverse islands. This book presents a complete summary of our current scientific knowledge about Borneo including the rainforest and riverine habitats that are endangered by logging and industrial development, along with a discussion of land use patterns and current problems. Kalimantan is the Indonesian portion of the huge island of Borneo.

Kalimantan has played a key role in Indonesia's economic development and is a major earner of foreign revenue due to the island's rich natural resources: forests, oil, gas, coal, and other minerals. In this book the authors argue that Kalimantan can be developed, but within tight ecological constraints and with great care. This book remains a standard reference for scientists, anthropologists, writers, and anyone interested in the region..

Borneo Mongabay

April 29th, 2020 - Borneo is the third largest island in the world covering an area of 743 330 square kilometers 287 000 square miles or a little more than the twice the size of Germany Politically the island is divided between Indonesia Malaysia and Brunei Indonesian Borneo is known as Kalimantan while Malaysian Borneo is known as East Malaysia
