"Amazon.de Few consumers have been attracted to 'clean' cars--those powered by something other than traditional internal combustion engines--because they aren't satisfied yet with critical factors such as appearance (too odd), cost (too high), dependability (too uncertain), and performance (too limited). The times they are a-changing, however. A host of catalysts, including new legal requirements and shifting public opinion, is finally driving automakers toward relevant alternative technologies that actually date back 160 years. And Jim Motavalli, who travels an unusual professional route as both syndicated auto columnist and environmental reporter, chronicles the buildup and potential payoff in his intriguing book *Forward Drive*. 'The information I came across ... described a personal transportation revolution that was becoming tantalizingly close,' he writes. 'Here, at last, were vehicles that promised to not only greatly reduce pollution but also to perform better, be more reliable, cruise farther, and last much longer than anything the public had ever seen.' Written for those 'who'd somehow failed to get their engineering Ph.D.s,' it absorbingly examines the history of such vehicles, the impact of gasoline automobiles, the pioneers who already utilize alternative power, the large and small R&D operations, the political and financial forces under which everything operates, and the broader picture of sustainable transportation. --Howard Rothman Autorenkommentar **The first reader-friendly book about fuel cell/hybrid cars.** *Forward Drive* is the first popularly written book about the new wave of hybrid and fuel cell cars, which I believe will revolutionize transportation in the 21st century. This book is about amazing, high-tech vehicles that go far beyond the simple range-limited battery electrics we've seen so far. Imagine a car that performs as well as a Ferrari, yet has double the range and produces only drinkable water out of its exhaust pipe! That's the promise of the fuel cell automobile, which is only a few years from the showroom floor. Meanwhile, 70-mile-per-gallon 'hybrid' cars (with both electric and gas engines) will be on the market in 2000 from Honda (the two-seater Insight) and Toyota (the four-seater Prius). I come to this topic with experience both as a 15-year automotive columnist and as an environmentalist who serves as editor of *E Magazine*. Writing for the only independent environmental magazine opened my eyes to the havoc wrought by cars--the smog they create, their contribution to global warming, and the sprawl that inevitably follows in the wake of their universal use. I didn't always see it that way. The day I got my driver's license, I drove the family station wagon 200 miles into the next state, so ecstatic was I at the prospect of liberation from the parental orbit. I bought a car as soon as I could, which was almost immediately. I tinkered with it on weekends. I subscribed to car magazines. I was a car nut. Cars are still a big part of my life. I've become accustomed to the shiny new test vehicles in my driveway. I've been to exotic places to drive new models, and gone on television and radio as an automotive guru. The car has certainly been good to me, but I'm becoming disenchanted. Driving down the empty, sun-dappled country lanes pictured in car commercials is certainly fun, but inching to work on crowded asphalt isn't. As I sit in traffic, windows tightly rolled up against the toxic fumes from all those idling exhausts, it's hard to remember the freedom I once felt. I've also learned a great deal about the harm caused by fossil fuels, as they're extracted, transported, burned, and fought over. And that's affected my love affair, too. I'm not sure you can call me a car 'enthusiast,' anymore, though I'm still hopelessly addicted to them. The good news is that cars are getting better, and quite rapidly. Automakers the world over are in a race to deliver the first fuel cell cars. The hybrids are here now. This book traces the history of alternative transportation, and it goes behind the scenes to test drive the experimental models the automakers are readying for the market. It makes the case that, despite a national mania for gas-guzzlers and sport-utility vehicles (SUVs), clean cars will soon predominate, pushed forward by hard environmental realities and worldwide legislation. Far from a dry dissertation, it's a wild ride through an industry in transition. The changes underway are as significant as the switch from horses to 'horseless carriages' 100 years ago. The new cars will not only be cleaner, they'll be better. What will your next car be like? Read *Forward Drive* and you'll get a good idea. Klappentext fuel cars from major automakers are entering the U.S. market -- promising far better performance and range than the disappointing electric vehicles of past decades -- 'clean' cars are no longer being relegated to side-show status; they're about to take center stage. **Forward Drive** presents the fascinating story of the race to build the cars of the future -- ones that can help to address the problems (including global warming, fossil-fuel depletion, and urban sprawl) that have accompanied the rise and spread of traditional gas-powered cars. The book traces the history of automobile development, including early attempts to create practical electric vehicles, and it explores new technologies for clean cars, especially hybrid (gas/electric) drives and hydrogen-based fuel cells. In his research, author Jim Motavalli conducted extensive interviews with fuel-cell makers, energy researchers, and key auto-industry figures at GM, Ford, DaimlerChrysler, Toyota, and Über den Autor und weitere Mitwirkende Jim Motavalli is the editor of *E: The Environmental Magazine* and a journalist who has written for *The New York Times*, the *Los Angeles Times* Syndicate, *Salon*, and many other publications. He also hosts a public-affairs radio show and teaches journalism at Fairfield University. He lives with his wife and two daughters in Fairfield, Connecticut."
